Keywords: protection zone – water resource – surface water – ground water – legislation – water legislation

The current situation in the field of water resources protection zones in the Czech Republic is problematic for a long time, not only in terms of their definition, but also the correct setting measures or data availability to the public. Protection zones are bounded by the Czech Republic for more than 50 years, and many of them are still in force, despite the objective reasons for the change.

In terms of legal instruments defining water resources protection zones moves at unstable environment. First, apply here Decree no. 137/1999 Coll., setting the list of water supply reservoirs and principles for the establishment and modification of protection zones of water sources. Second, the definition of water resources protection zones is conforming to § 30 of Act no. 254/2001 Coll., on waters. This may produce different attitudes to the whole issue.
