

NUTRIENTS IN THE MOSTIŠTĚ RIVER BASIN

JURAN, S.

TGM Water Research Institute, p. r. i.

Keywords: Mostišť River Basin – water quality – modelling emission of nutrients – surface and diffuse sources of pollution – river basin management plans – measures

The article presents the results of the project aimed at improving the situation in the catchment area of the Mostišť water reservoir where good water status is not achieved because of the high water load of nutrients. In the light of the findings, it is recommended to introduce detailed analyzes in river basins where water quality has not yet been achieved. It is important to further refine and complete the knowledge gained in similar projects so that the situation can be gradually compared in different regions of the Czech Republic.
