Keywords: COVID 19 – SARS-CoV-2 – wastewater – surface water – contamination – wastewater based epidemiology – early-warning tool – biomarker

The paper provides actual clear information about viruses and coronaviruses, including SARS-CoV-2, the possibility of contamination of surface water and wastewater by this virus. The RT-qPCR method of determination of SARS-CoV-2 in water is also described. The use of monitoring the presence of the virus in wastewater as biomarker to monitor its occurrence in the population and as an early-warning tool of a possible new wave of disease is also mentioned.
